FROMMER LAWRENCE & HAUG

005

U.S. Patent Application No. 09/966,704  
Reply to Final Office Action dated May 3, 2006

PATENT  
450100-03501

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application. An identifier indicating the status of each claim is provided.

Listing of Claims

1. (Currently Amended) An audience response determination apparatus for determining an audience response, comprising:

overall state detection means for detecting the overall state of an audience;

individual state detection means for detecting the individual states of the members of the audience; and

determination means for determining the audience response on the basis of information detected by said overall state detection means and by said individual state detection means,

wherein said determination means for determining the audience response comprises an audience state determination unit for estimating the audience response based upon identifying values of respective determination signals and auxiliary information,

wherein said auxiliary information indicates a current state of playback being presented to said audience.

2. (Original) An audience response determination apparatus according to claim 1, wherein said overall state detection means takes an image of the entire audience and detects the overall bodily state of the audience based on the image taken.

U.S. Patent Application No. 09/966,704  
Reply to Final Office Action dated May 3, 2006

PATENT  
450100-03501

3. (Previously Presented) An audience response determination apparatus according to claim 1, wherein said overall state detection means collects sounds uttered by the entire audience and detects the overall state of the audience based on the sounds collected.

4. (Original) An audience response determination apparatus according to claim 1, wherein said individual state detection means detects a load applied to each of the audience's seats.

5. (Original) An audience response determination apparatus according to claim 1, wherein said individual state detection means detects a stepping force provided by each member of said audience.

6. (Original) An audience response determination apparatus according to claim 5, wherein said individual state detection means comprises:

first stepping force detection means for detecting a stepping force provided by the left foot of each member of said audience; and  
second stepping force detection means for detecting a stepping force provided by the right foot of each member of said audience.

7. (Currently Amended) A playback output control system for controlling the output from playback means for the playback and output of data to be seen or heard by an audience, comprising:

overall state detection means for detecting an overall state of said audience;

U.S. Patent Application No. 09/966,704  
Reply to Final Office Action dated May 3, 2006

PATENT  
450100-03501

individual state detection means for detecting individual states of the members of said audience;

determination means for determining an audience response on the basis of the information detected by said overall state detection means and by said individual state detection means,

wherein said determination means for determining an audience response comprises an audience state determination unit for estimating the audience response based upon identifying values of respective determination signals and auxiliary information,

wherein said auxiliary information indicates a current state of the playback being presented to said audience; and

control means for controlling the operation of said playback means based on the audience response determined by said determination means.

8. (Original) A playback output control system according to claim 7, wherein said control means selects, on the basis of said audience response determined by said determination means, data to be played back by said playback means.

9. (Original) A playback output control system according to claim 7, wherein said control means controls, on the basis of said audience response determined by said determination means, signal processing on the data played back by said playback means.

10. (Previously Presented) A playback output control system according to claim 7, wherein said overall state detection means takes an image of said audience and detects

Reply to Final Office Action dated May 3, 2006

PATENT  
450100-03501

the overall bodily state of said audience based on the image.

11. (Original) A playback output control system according to claim 10, further comprising reduction means for reducing the effect of video data played back by and output from said playback means, wherein said overall state detection means detects the overall bodily state of said audience by reducing the effect of said video data.

12. (Previously Presented) A playback output control system according to claim 7, wherein said overall state detection means detects the overall state of said audience by collecting sounds emitted by the audience.

13. (Original) A playback output control system according to claim 12, further comprising reduction means for reducing the effect of sound data played back and output by said playback means, wherein overall state detection means detects the overall state of the audience by reducing the effect of said sound data.

14. (Original) A playback output control system according to claim 12, wherein said overall state detection means detects the overall state of the audience by comparing the collected sounds with a reference sound level.

15. (Original) A playback output control system according to claim 14, further comprising varying means for varying said reference sound level on the basis of the

PATENT  
450100-03501

audience size.

16. (Original) A playback output control system according to claim 12, further comprising a filter which passes a predetermined audio band, wherein said overall state determination means detects the overall state of the audience based on the sound passed through said filter.

17. (Original) A playback output control system according to claim 7, wherein said individual state detection means detects a load applied to each of the audience's seats.

18. (Previously Presented) A playback output control system according to claim 17, further comprising auxiliary information input means for inputting the auxiliary information.

19. (Original) A playback output control system according to claim 7, wherein said individual state detection means detects a stepping force provided by each member of the audience.

20. (Original) A playback output control system according to claim 19, wherein said individual state detection means comprises:  
first stepping force detection means for detecting a stepping force provided by the left foot of each member of the audience; and

U.S. Patent Application No. 09/966,704  
Reply to Final Office Action dated May 3, 2006

PATENT  
450100-03501

second stepping force detection means for detecting a stepping force provided by the right foot of each member of the audience.

21. (Currently Amended) An audience response determination method for determining an audience response, comprising the steps of:

detecting an overall state of an audience;

detecting individual states of the members of said audience; and

determining the audience response based on information detected by the steps of detecting the overall state of said audience and detecting the individual states of the members of said audience,

wherein the step of determining the audience response comprises an audience state determination unit for estimating the audience response based upon identifying values of respective determination signals and auxiliary information,

wherein said auxiliary information indicates a current state of playback being presented to said audience.

22. (Currently Amended) A playback output control method for controlling a playback output, comprising the steps of:

detecting an overall state of an audience;

detecting individual states of the members of said audience;

determining an audience response based on information detected by the steps of detecting the overall state of said audience and detecting the individual states of the members of said audience,

U.S. Patent Application No. 09/966,704  
Reply to Final Office Action dated May 3, 2006

PATENT  
450100-03501

wherein the step of determining the audience response comprises an audience state determination unit for estimating the audience response based upon identifying values of respective determination signals and auxiliary information,  
wherein said auxiliary information indicates a current state of the playback output being presented to said audience; and  
controlling the playback operation of data to be seen or heard by said audience based on the audience response determined in the determination step.

23. (Currently Amended) A data recording medium recording a processing program comprising the steps of:

detecting an overall state of an audience;  
detecting individual states of the members of said audience; and  
determining an audience response based on information detected by the steps of detecting the overall state of said audience and detecting individual states of the members of said audience,

wherein the step of determining the audience response comprises an audience state determination unit for estimating the audience response based upon identifying values of respective determination signals and auxiliary information,

wherein said auxiliary information indicates a current state of playback being presented to said audience.

24. (Currently Amended) A data recording medium recording a processing program comprising the steps of:

U.S. Patent Application No. 09/966,704  
Reply to Final Office Action dated May 3, 2006

PATENT  
450100-03501

detecting an overall state of an audience;  
detecting individual states of the members of said audience;  
determining an audience response based on information detected by the steps of  
detecting the overall state of said audience and detecting the individual states of the members of  
said audience,

wherein the step of determining the audience response comprises an  
audience state determination unit for estimating the audience response based upon identifying  
values of respective determination signals and auxiliary information.

wherein said auxiliary information indicates a current state of playback  
being presented to said audience; and

controlling a playback operation of data to be seen or heard by said audience  
based on the audience response determined by the determination step.
